PROFESSIONAL SUMMARY

I'm a full stack developer with 6 years of experience shipping web and mobile apps that people actually use. I work across the full stack — React, TypeScript, and the TanStack ecosystem on the frontend, Node.js, Express, NestJS, and PostgreSQL on the backend, and Flutter and React Native for mobile. I care about writing code that other developers can read and extend without headaches. I've worked on NGO platforms, food delivery marketplaces, property management systems, enterprise ERPs, and civic tech apps — from first commit to production.

FRONTEND

React Hooks, composition, Context, Suspense, lazy loading, concurrent rendering

TypeScript Strict mode, discriminated unions, utility types, generics, type inference

TanStack Router, Query, Form — server state, routing, forms, validation

Zod Schema validation, type inference across APIs, routing, and forms

Styling Tailwind CSS, Shadcn/UI, Radix UI, Ant Design, SCSS

Build Vite, Webpack — bundling, code splitting, tree shaking, optimisation

BACKEND

Node.js Express.js, NestJS, REST APIs, GraphQL, WebSocket, microservices

Python FastAPI, OpenAI API integration, real-time streaming

Auth JWT, OAuth2, OIDC, 2FA, RBAC, session management

APIs REST, GraphQL, webhooks, API design, rate limiting, security

DATABASE

SQL PostgreSQL, MySQL — Prisma, TypeORM, schema design, query optimisation

NoSQL MongoDB, SQLite, Redis (familiar)

MOBILE

Flutter Dart, production

WORK HISTORY

Senior Front-End Developer · Raising The Village

Oct 2025 - Present | Mbarara, Uganda (On-site)

- ▶ I work on the implementation management system — an internal tool RTV's field officers, coaches, and program managers use to track household-level development work across Uganda, Rwanda, DRC, and Tanzania.
- ▶ Agriculture module — seed distribution, seed replacement, seedlings, nursery beds, tools distribution, demo gardens, and livestock tracking. Built the forms, tables, and reporting views.
- ▶ VSLA and Village Savings Fund — savings groups, loans, member tracking, and initiative management. Built dashboards and data entry flows for field officers.
- ▶ Training module — session attendance, training types and categories, household-level training reports filterable by region, district, cluster, village, cohort, and cycle.
- ▶ Leadership module — village, agriculture, WASH, and coffee champions (community volunteers), committees, and water source tracking.
- ▶ Coaching and household check-ins — field officers log household visits and compliance against best-practice checklists (nursery bed setup, farming practices, water sources). Built the compliance and adoption dashboards.
- ▶ Home dashboard and per-program dashboards showing project participation, household adoption rates, visit coverage, and program monitoring — all filterable by region, district, cluster, village, cohort, and cycle.
- ▶ WorkMate — an embedded AI assistant backed by an external data-science API. I built the chat widget in React/TypeScript that lets program staff query program data conversationally.
- ▶ Stack: React, TypeScript, Redux Toolkit Query, TanStack Router, TanStack Query, TanStack Form, Ant Design, ApexCharts — consuming multiple microservices behind a gateway. Docker, GitHub Actions CI/CD.

Full Stack Developer (Contract) · Dango Tech Concept Limited

Jan 2025 - Jan 2026 | Kampala, Uganda

- ▶ Built The ClarityDesk in React Native — a civic app for the South Sudan 2026 elections. Offline-first, designed for areas with no reliable internet. Live on both the App Store (com.claritydesk.com) and Play Store (com.claritydesk).
- ▶ Built Dangopay in Flutter — a payment app for rent and water bills in Uganda. Real users, real mobile money transactions. Live on Google Play Store (com.dangopay).
- ▶ Built Nyumba Yo — a property management system covering landlord listings, tenant management, and rent collection.
- ▶ Built Wellowe — an online clothing store for a Ugandan fashion brand, with product listings, cart, and checkout.
- ▶ Built a full Next.js web platform from scratch — TanStack Router, TanStack Query, TanStack Form + Zod, Tailwind CSS, Node.js/Express, PostgreSQL.

apps — App Store & Play Store

React Native Expo, EAS
Build — production apps — both stores

DEVOPS & QUALITY

CI/CD GitHub Actions, Docker, AWS, NGINX, automated pipelines

Testing Vitest, Jest, Playwright, Cypress, React Testing Library

Observability Sentry, error boundaries, frontend monitoring

LIVE PRODUCTION WORK

nyumbanapp.com
web.nyumbanapp.com/app/rent
tracecorpsolutions.com

RTV App — App Store & Play Store

ClarityDesk — App Store & Play Store

Dangopay — Play Store

EDUCATION

BSc Information Technology
Kyambogo University, Uganda
2015 - 2018

Web Dev Bootcamp

Microverse (Remote) · 2022

Dockerised, NGINX, CI/CD pipeline set up from zero.

- ▶ Connected a Python FastAPI backend to the OpenAI API and streamed the responses over WebSocket to the frontend in real time.

Full Stack Developer · NyumbanApp

Jan 2025 - Present | Kampala, Uganda

- ▶ Building nyumbanapp.com — a rental property platform connecting landlords and tenants across Uganda. I built both the web app and the React Native mobile app.
- ▶ Landlord side: list properties, set rent and utility rates, manage units and occupancy, review tenant applications, approve or decline requests, schedule tours, and track payments.
- ▶ Tenant side: browse verified listings, apply for rentals, schedule tours, pay rent digitally, view payment history and balance, and message landlords directly in the app.
- ▶ Rent payments go through Dusupay — mobile money (MTN, Airtel) and bank transfer. Both sides see payment status in real time.
- ▶ Tour requests, approvals, and reschedules are tracked with status updates and notifications throughout.
- ▶ In-app messaging replaces WhatsApp and phone calls — conversations are tied to the specific rental relationship.
- ▶ User accounts cover registration, login, profiles, and payment history — role-based access for landlords, tenants, agents, and admins.
- ▶ Stack: React Native (iOS and Android), Next.js, TypeScript, TanStack Router, TanStack Query, TanStack Form + Zod, Tailwind CSS, Shadcn/UI, Node.js/Express, PostgreSQL.

Senior Front-End Developer · Tracecorp Solutions

May 2023 - Sep 2025 | Kampala, Uganda

- ▶ Tracecorp builds ERP, utility billing, CRM, and asset management systems for water utilities across Africa — clients include Lagos Water Corporation, state water boards in Ogun, Osun, Oyo, and Kaduna, and utilities in Ethiopia and South Sudan.
- ▶ I led the frontend across the full ERP — Accounting, Water Billing, CRM, HRMS, and Asset Management — running at water utilities in South Sudan, Ethiopia, and Nigeria.
- ▶ Built a shared component library used across all eight modules — same design system, same patterns, consistent behaviour everywhere.
- ▶ TanStack Query handled server state across all modules — cache strategies, invalidation, and optimistic updates on every form submission and data mutation.
- ▶ TypeScript strict throughout — discriminated unions, generics, utility types, Zod schemas shared between API contracts and form validation.
- ▶ Led the JavaScript to TypeScript migration on a live codebase — zero downtime, done module by module. Also ran code reviews and set frontend standards for the team.

Full Stack Developer · Yookatale

Feb 2020 - Nov 2022 | Kampala, Uganda

- ▶ Built the web platform for Yookatale — Uganda's online grocery and food delivery marketplace. Next.js, TypeScript, Node.js, MongoDB. Owned it end to end.
- ▶ Customers browse food, fresh produce, groceries, supplements, and ready-to-eat meals across categories like vegetables, dairy, proteins, herbs, juices, and carbohydrates.
- ▶ Cart, wishlist, user accounts, purchase history, product search, budget filtering, and category navigation — all built and maintained.
- ▶ Payment methods: mobile money (MTN, Airtel), Visa/debit cards, cash on delivery, and YooCard — single checkout flow covering all of them.
- ▶ Order management: same-day delivery, real-time order tracking, delivery zone logic, and WhatsApp integration for order updates.
- ▶ Subscriptions for food and meal plans — breakfast, lunch, supper selection, cuisine filtering, weekly deals, and seasonal promotions.
- ▶ Loyalty system: points accumulation, referral rewards, and YooCard delivery perks — built into the account dashboard.
- ▶ Vendor portal: seller onboarding, product listing management, and partner

services for market participants.

- Mobile apps built in Flutter for Android and iOS alongside the web platform. Cut load time by 20% through Next.js optimisation and code splitting.
